

## Award of Distinction Tree Relocation

Presented to - Arborwell

The tree work was restricted from 5:30 am - 10 am because the site is both residential and commercial. Arborists had to work in a very close environment with up to 1500 other contract laborers. Numerous types of motor vehicles, aerial lifts, fork lifts, backhoes, delivery trucks, etc. were in the vicinity. Safety and crowd control issues were paramount in the success of the project, as well as the challenge to maintain the health and vigor of the trees during the chaotic construction period.

The project is unique in this area because it combines business retail and residential space in one location. One city block was redeveloped to build this integrated community.

The transplanted trees provided the central pivot around which this community was built. The Oaks are now the center of business and recreational life at Santana Row. This type of high density development is a good example for future urban renewal projects that can still accommodate the aesthetic and functional benefits of trees.

This oak was replanted after 18 months out of the ground.

This was the only tree left in the ground throughout construction and had to be protected.

## Santana Row

Care has been continuous for two years. Work has included pest and disease control and the maintenance of soil moisture and nutrient levels.
